

The triple linking number is an ambiguous Hopf invariant

Clayton Shonkwiler

Department of Mathematics
University of Pennsylvania

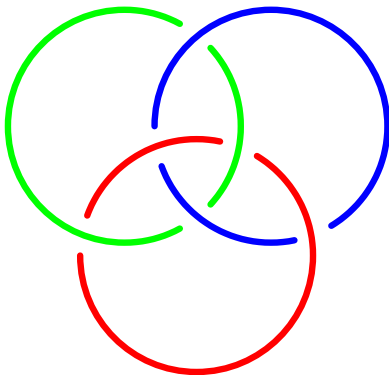

Geometry-Topology Reading Seminar
April 15, 2008

Let $L = L_1 \cup L_2 \cup L_3$ be a smooth 3-component link in S^3 , where

$$L_1 = \{x(s)\}$$

$$L_2 = \{y(t)\}$$

$$L_3 = \{z(u)\}$$

Theorem (Milnor)

3-component links $L = L_1 \cup L_2 \cup L_3$ are determined up to link-homotopy by the pairwise linking numbers $p_L, q_L, r_L \in \mathbb{Z}$ and the triple linking number $\bar{\mu}_L \in \mathbb{Z}/\gcd(p, q, r)$.

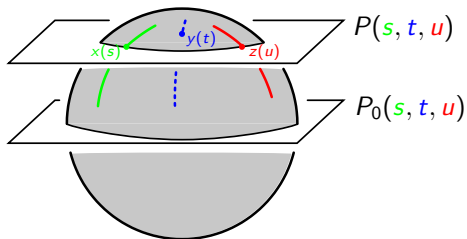

Theorem (Milnor)

3-component links $L = L_1 \cup L_2 \cup L_3$ are determined up to link-homotopy by the pairwise linking numbers $p_L, q_L, r_L \in \mathbb{Z}$ and the triple linking number $\bar{\mu}_L \in \mathbb{Z}/\gcd(p, q, r)$.

Theorem (Pontryagin)

Maps $f : S^1 \times S^1 \times S^1 \rightarrow S^2$ are determined up to homotopy by the degrees $p_f, q_f, r_f \in \mathbb{Z}$ of the restrictions of f to the 2-dimensional subtori and by an ambiguous Hopf invariant $\nu_f \in \mathbb{Z}/2\gcd(p, q, r)$.

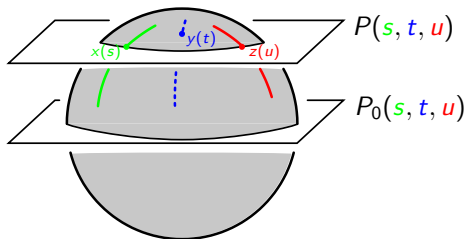

The Associated Map

$$g_L : S^1 \times S^1 \times S^1 \rightarrow G_2\mathbb{R}^4$$

$$(s, t, u) \mapsto P_0(s, t, u)$$

The Associated Map

$$g_L : S^1 \times S^1 \times S^1 \rightarrow G_2\mathbb{R}^4$$
$$(s, \quad t, \quad u) \mapsto P_0(s, t, u)$$

$$S^1 \times S^1 \times S^1 \xrightarrow{g_L} G_2\mathbb{R}^4 \simeq S^2 \times S^2 \xrightarrow{\pi_1} S^2.$$

Define $f_L := \pi_1 \circ g_L$.

Let

$$\begin{aligned}\tilde{f}(s, t, u) = & (x(s) \cdot iy(t) + y(t) \cdot iz(u) + z(u) \cdot ix(s), \\ & x(s) \cdot jy(t) + y(t) \cdot jz(u) + z(u) \cdot jx(s), \\ & x(s) \cdot ky(t) + y(t) \cdot kz(u) + z(u) \cdot kx(s)).\end{aligned}$$

Then

$$f_L(s, t, u) = \frac{\tilde{f}(s, t, u)}{\|\tilde{f}(s, t, u)\|}.$$

Let

$$\begin{aligned}\tilde{f}(s, t, u) = & (x(s) \cdot iy(t) + y(t) \cdot iz(u) + z(u) \cdot ix(s), \\ & x(s) \cdot jy(t) + y(t) \cdot jz(u) + z(u) \cdot jx(s), \\ & x(s) \cdot ky(t) + y(t) \cdot kz(u) + z(u) \cdot kx(s)).\end{aligned}$$

Then

$$f_L(s, t, u) = \frac{\tilde{f}(s, t, u)}{\|\tilde{f}(s, t, u)\|}.$$

Note

$f_L(s, t, u)$ is invariant under even permutations of the coordinates.

Theorem

Given a 3-component link L and the associated map
 $f_L : S^1 \times S^1 \times S^1 \rightarrow S^2$,

- The pairwise linking numbers p_L, q_L, r_L of L are the same as the degrees $p_{f_L}, q_{f_L}, r_{f_L}$ of f_L restricted to the 2-dimensional subtori.
- Moreover, $\bar{\mu}_L$ is equal to $1/2$ the Pontryagin invariant ν_{f_L} .

Pairwise linking numbers are degrees

$$S^1 \times S^1 \times S^1 \xrightarrow{C} \text{Conf}_3(S^3) \simeq S^3 \times S^2 \xrightarrow{\pi_2} S^2$$

Pairwise linking numbers are degrees

$$S^1 \times S^1 \times S^1 \xrightarrow{C} \text{Conf}_3(S^3) \simeq S^3 \times S^2 \xrightarrow{\pi_2} S^2$$

Define $F_L := \pi_2 \circ C$; in coordinates,

$$F_L(s, t, u) = \frac{\text{Stereo}_1(x(s)^{-1}y(t) - x(s)^{-1}z(u))}{\|\text{Stereo}_1(x(s)^{-1}y(t) - x(s)^{-1}z(u))\|},$$

Pairwise linking numbers are degrees

$$S^1 \times S^1 \times S^1 \xrightarrow{C} \text{Conf}_3(S^3) \simeq S^3 \times S^2 \xrightarrow{\pi_2} S^2$$

Define $F_L := \pi_2 \circ C$; in coordinates,

$$F_L(s, t, u) = \frac{\text{Stereo}_1(x(s)^{-1}y(t) - x(s)^{-1}z(u))}{\|\text{Stereo}_1(x(s)^{-1}y(t) - x(s)^{-1}z(u))\|},$$

Facts

- F_L is homotopic to f_L .
- F_L restricted to the subtorus $\{s_0\} \times S^1 \times S^1$ is just the familiar Gauss map, so its degree is equal to the pairwise linking number

$$r_L = Lk(L_2, L_3).$$

$$[[S^1 \cup S^1 \cup S^1, S^3]] = \{3\text{-component links up to link-homotopy}\}$$

map taking L to f_L

$$[S^1 \times S^1 \times S^1, S^2] = \{\text{maps } S^1 \times S^1 \times S^1 \rightarrow S^2 \text{ up to homotopy}\}$$

$$\begin{array}{l}
 [[S^1 \cup S^1 \cup S^1, S^3]] = \{3\text{-component links up to link-homotopy}\} \\
 \downarrow \mathbb{F} \quad \text{map taking } L \text{ to } f_L \\
 [S^1 \times S^1 \times S^1, S^2] = \{\text{maps } S^1 \times S^1 \times S^1 \rightarrow S^2 \text{ up to homotopy}\}
 \end{array}$$

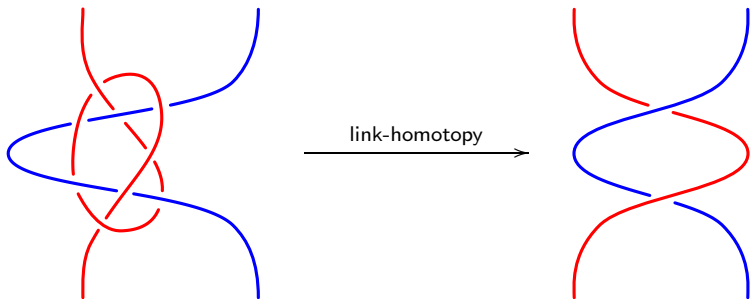

Theorem A says \mathbb{F} is one-to-one and describes it.

$$\begin{array}{l}
 [[S^1 \cup S^1 \cup S^1, S^3]] = \{3\text{-component links up to link-homotopy}\} \\
 \downarrow \mathbb{F} \quad \text{map taking } L \text{ to } f_L \\
 [S^1 \times S^1 \times S^1, S^2] = \{\text{maps } S^1 \times S^1 \times S^1 \rightarrow S^2 \text{ up to homotopy}\}
 \end{array}$$

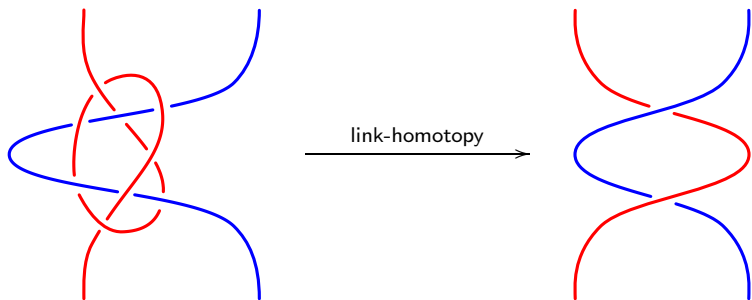

Theorem A says \mathbb{F} is one-to-one and describes it.

Algebra?

A *string link* is a pure tangle:

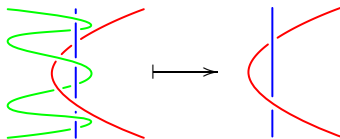

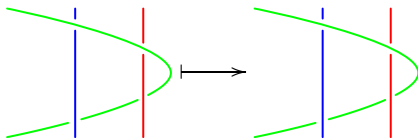

A *string link* is a pure tangle:

n -stranded string links up to link homotopy form a group, $\mathcal{H}(n)$, with the group operation given by stacking string links.

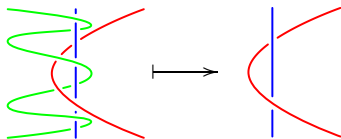

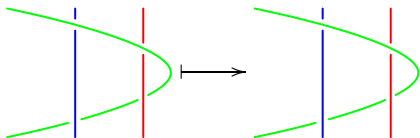

The Structure of $\mathcal{H}(n)$

$$1 \longrightarrow RF(n-1) \longrightarrow \mathcal{H}(n) \longrightarrow \mathcal{H}(n-1) \longrightarrow 1$$

The Structure of $\mathcal{H}(n)$

$$1 \longrightarrow RF(n-1) \longrightarrow \mathcal{H}(n) \longrightarrow \mathcal{H}(n-1) \longrightarrow 1$$

Proposition (Habegger-Lin)

This is a split exact sequence.

The connection between string links and links

Theorem (Habegger-Lin)

Two string links $\sigma, \sigma' \in \mathcal{H}(n) \simeq \mathcal{H}(n-1) \times RF(n-1)$ close up to link-homotopic n -component links if and only if σ and σ' are related by a sequence of conjugacies and “partial conjugacies” in $\mathcal{H}(n)$.

The connection between string links and links

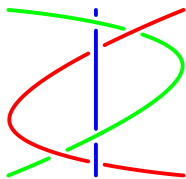

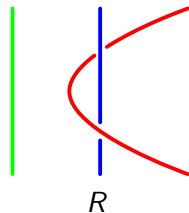

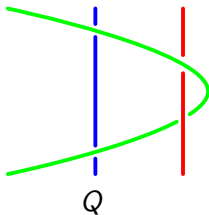

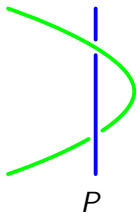

Theorem (Habegger-Lin)

Two string links $\sigma, \sigma' \in \mathcal{H}(n) \simeq \mathcal{H}(n-1) \times RF(n-1)$ close up to link-homotopic n -component links if and only if σ and σ' are related by a sequence of conjugacies and “partial conjugacies” in $\mathcal{H}(n)$.

Remark

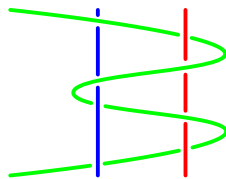

When $n = 3$, there are no “partial conjugacies”, so two elements of $\mathcal{H}(3)$ close up to the same 3-component link (up to link-homotopy) if and only if they are conjugate.

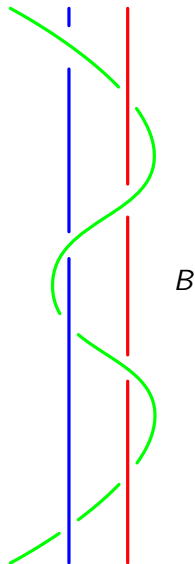

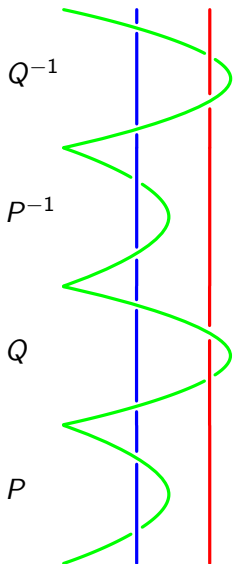

Generators of $\mathcal{H}(3)$

=

B

Lemma

①

$$\mathcal{H}(3) = \langle P, Q, R, B \mid [P, Q] = [Q, R] = [R, P] = B, \\ [P, B] = [Q, B] = [R, B] = 1 \rangle$$

Lemma

①

$$\mathcal{H}(3) = \langle P, Q, R, B \mid [P, Q] = [Q, R] = [R, P] = B, \\ [P, B] = [Q, B] = [R, B] = 1 \rangle$$

② *Elements of $\mathcal{H}(3)$ can be written in the normal form*

$$P^p Q^q R^r B^\mu$$

Lemma

①

 [S^1 \times S^1 \times S^1, S^2] & \longleftarrow & \pi_1 \text{Maps}(S^1 \times S^1, S^2)
 \end{array}$$

The bottom map sends based loops to free loops and interprets them as maps $S^1 \times S^1 \times S^1 \rightarrow S^2$. Point inverse images of the bottom map are conjugacy classes.

$$\pi_1 \text{Maps}(S^1 \times S^1, S^2) = \bigcup_{p \in \mathbb{Z}} \pi_1 (\text{Maps}(S^1 \times S^1, S^2), \varphi_p)$$

where $\varphi_p : S^1 \times S^1 \rightarrow S^2$ is a map of degree p .

$$\begin{array}{ccc}
 [[S^1 \cup S^1 \cup S^1, S^3]] & \longleftarrow & \mathcal{H}(3) \\
 \downarrow \mathbb{F} & & \downarrow ? \\
 [S^1 \times S^1 \times S^1, S^2] & \longleftarrow & \bigcup_{p \in \mathbb{Z}} \pi_1 (\text{Maps}(S^1 \times S^1, S^2), \varphi_p)
 \end{array}$$

$$\begin{array}{ccc}
 [[S^1 \cup S^1 \cup S^1, S^3]] & \longleftarrow & \mathcal{H}(3) \\
 \downarrow \mathbb{F} & & \downarrow ? \\
 [S^1 \times S^1 \times S^1, S^2] & \longleftarrow & \bigcup_{p \in \mathbb{Z}} \pi_1 (\text{Maps}(S^1 \times S^1, S^2), \varphi_p)
 \end{array}$$

Let $\mathcal{H}_0(3) \simeq RF(2)$ be the subgroup consisting of those 3-strand string links in which the first and second strands are unlinked.

$$\mathcal{H}_0(3) = \langle Q, R, B \mid [Q, R] = B, [Q, B] = [R, B] = 1 \rangle$$

$$\begin{array}{ccc}
 [[S^1 \cup S^1 \cup S^1, S^3]] & \longleftarrow & \mathcal{H}(3) \\
 \downarrow \mathbb{F} & & \downarrow ? \\
 [S^1 \times S^1 \times S^1, S^2] & \longleftarrow & \bigcup_{p \in \mathbb{Z}} \pi_1 (\text{Maps}(S^1 \times S^1, S^2), \varphi_p)
 \end{array}$$

Let $\mathcal{H}_0(3) \simeq RF(2)$ be the subgroup consisting of those 3-strand string links in which the first and second strands are unlinked.

$$\mathcal{H}_0(3) = \langle Q, R, B \mid [Q, R] = B, [Q, B] = [R, B] = 1 \rangle$$

Consider the coset

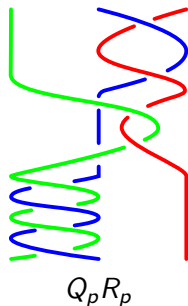

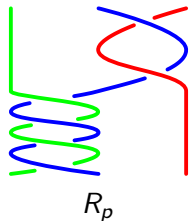

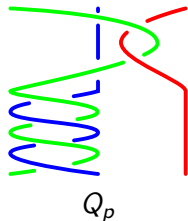

$$\mathcal{H}_p(3) := P^p \mathcal{H}_0(3)$$

and endow it with the group structure of $\mathcal{H}_0(3)$.

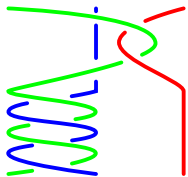

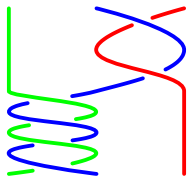

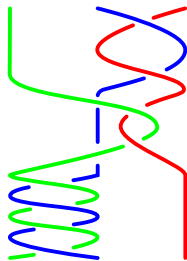

$$\begin{array}{ccc}
 [[S^1 \cup S^1 \cup S^1, S^3]] & \longleftarrow & \bigcup_{p \in \mathbb{Z}} \mathcal{H}_p(3) \\
 \downarrow \mathbb{F} & & \downarrow \widehat{\mathbb{F}} \\
 [S^1 \times S^1 \times S^1, S^2] & \longleftarrow & \bigcup_{p \in \mathbb{Z}} \pi_1 (\text{Maps}(S^1 \times S^1, S^2), \varphi_p)
 \end{array}$$

We want to define $\widehat{\mathbb{F}}$ as a union of group homomorphisms.

Let $Q_p := P^p Q$, $R_p := P^p R$, $B_p = P^p B$.

Let $Q_p := P^p Q$, $R_p := P^p R$, $B_p = P^p B$.

 Q_p  R_p  $Q_p R_p$

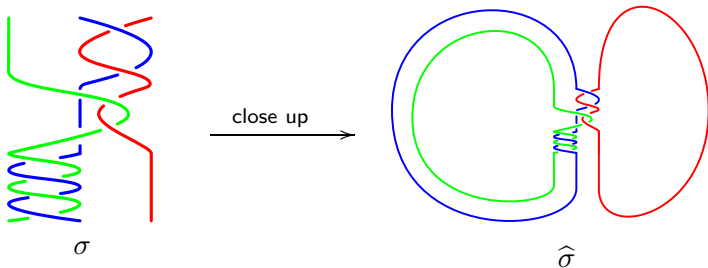

Then

$$\mathcal{H}_p(3) = \langle Q_p, R_p, B_p \mid [Q_p, R_p] = B_p, [Q_p, B_p] = [R_p, B_p] = 1 \rangle.$$

To define

$$\widehat{\mathbb{F}} : \mathcal{H}_p(3) \rightarrow \pi_1(\text{Maps}(S^1 \times S^1, S^2), \varphi_p),$$

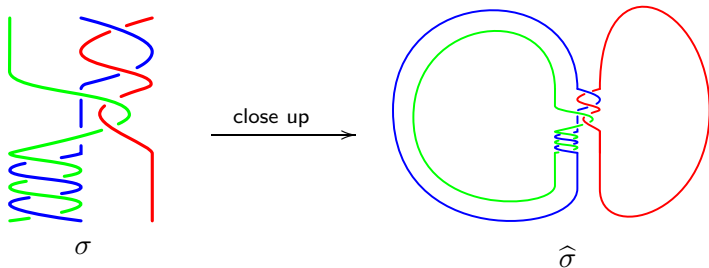

close up $\sigma \in \mathcal{H}_p(3)$ to get a 3-component link $\widehat{\sigma}$.

To define

$$\widehat{\mathbb{F}} : \mathcal{H}_p(3) \rightarrow \pi_1(\text{Maps}(S^1 \times S^1, S^2), \varphi_p),$$

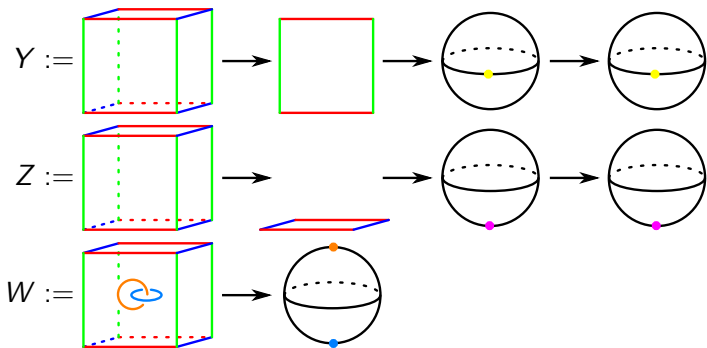

close up $\sigma \in \mathcal{H}_p(3)$ to get a 3-component link $\widehat{\sigma}$.

Then $f_{\widehat{\sigma}}$ represents an element $\alpha_{\sigma} \in \pi_1(\text{Maps}(S^1 \times S^1, S^2), \varphi_p)$.
 Define $\widehat{\mathbb{F}}(\sigma) := \alpha_{\sigma}$.

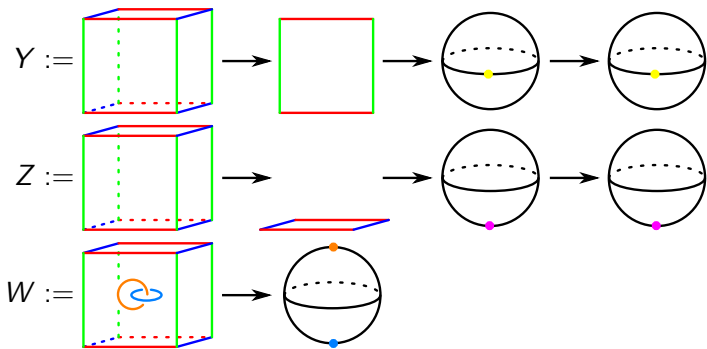

A Presentation for $\pi_1(\text{Maps}(S^1 \times S^1, S^2), \varphi_0)$

Define:

A Presentation for $\pi_1(\text{Maps}(S^1 \times S^1, S^2), \varphi_0)$

Define:

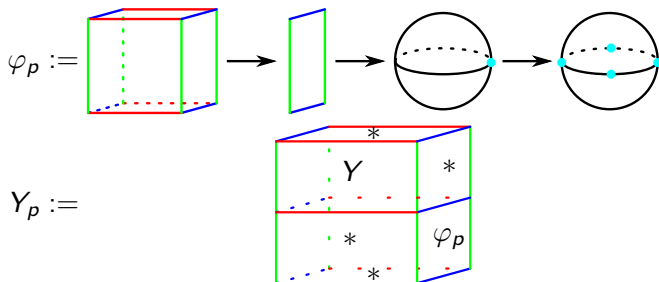

Theorem (Fox)

$$\begin{aligned} \pi_1(\text{Maps}(S^1 \times S^1, S^2), \varphi_p) &= \tau_3(S^2) \\ &= \langle Y, Z, W \mid [Y, Z] = W^2, [Y, W] = [Z, W] = 1 \rangle \end{aligned}$$

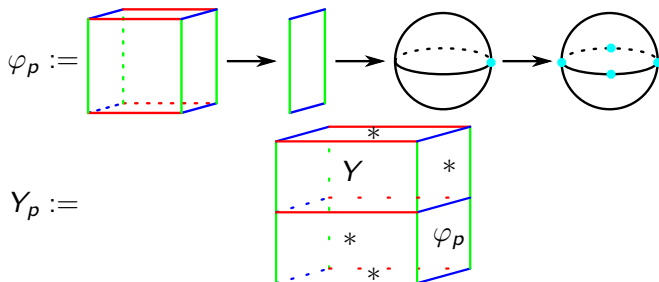

A Presentation for $\pi_1(\text{Maps}(S^1 \times S^1, S^2), \varphi_p)$

Define:

A Presentation for $\pi_1(\text{Maps}(S^1 \times S^1, S^2), \varphi_p)$

Define:

Theorem (Larmore-Thomas, Kallel)

$$\begin{aligned} & \pi_1(\text{Maps}(S^1 \times S^1, S^2), \varphi_p) \\ &= \langle Y_p, Z_p, W_p \mid [Y_p, Z_p] = W_p^2, W_p^{2|p|} = 1, [Y_p, W_p] = [Z_p, W_p] = 1 \rangle \end{aligned}$$

$$\mathcal{H}_p(3) \rightarrow \pi_1(\text{Maps}_p(S^1 \times S^1, S^2), \varphi_p)$$

Recall that we have the presentations

$$\mathcal{H}_p(3) = \langle Q_p, R_p, B_p \mid [Q_p, R_p] = B_p, [Q_p, B_p] = [R_p, B_p] = 1 \rangle$$

$$\begin{aligned} & \pi_1(\text{Maps}(S^1 \times S^1, S^2), \varphi_p) \\ &= \langle Y_p, Z_p, W_p \mid [Y_p, Z_p] = W_p^2, W_p^{2|p|} = 1, [Y_p, W_p] = [Z_p, W_p] = 1 \rangle \end{aligned}$$

$$\mathcal{H}_p(3) \rightarrow \pi_1(\text{Maps}_p(S^1 \times S^1, S^2), \varphi_p)$$

Recall that we have the presentations

$$\mathcal{H}_p(3) = \langle Q_p, R_p, B_p \mid [Q_p, R_p] = B_p, [Q_p, B_p] = [R_p, B_p] = 1 \rangle$$

$$\begin{aligned} & \pi_1(\text{Maps}(S^1 \times S^1, S^2), \varphi_p) \\ &= \langle Y_p, Z_p, W_p \mid [Y_p, Z_p] = W_p^2, W_p^{2|p|} = 1, [Y_p, W_p] = [Z_p, W_p] = 1 \rangle \end{aligned}$$

and that

$$Q_p^q R_p^r B_p^\mu, \text{ and } Q_p^{q'} R_p^{r'} B_p^{\mu'}$$

close up to the same 3-component link if and only if

$$q = q', \quad r = r', \quad \mu \equiv \mu' \pmod{\gcd(p, q, r)}.$$

$$\mathcal{H}_p(3) \rightarrow \pi_1(\text{Maps}_p(S^1 \times S^1, S^2), \varphi_p)$$

Recall that we have the presentations

$$\mathcal{H}_p(3) = \langle Q_p, R_p, B_p \mid [Q_p, R_p] = B_p, [Q_p, B_p] = [R_p, B_p] = 1 \rangle$$

$$\begin{aligned} & \pi_1(\text{Maps}(S^1 \times S^1, S^2), \varphi_p) \\ &= \langle Y_p, Z_p, W_p \mid [Y_p, Z_p] = W_p^2, W_p^{2|p|} = 1, [Y_p, W_p] = [Z_p, W_p] = 1 \rangle \end{aligned}$$

and that

$$Q_p^q R_p^r B_p^\mu, \text{ and } Q_p^{q'} R_p^{r'} B_p^{\mu'}$$

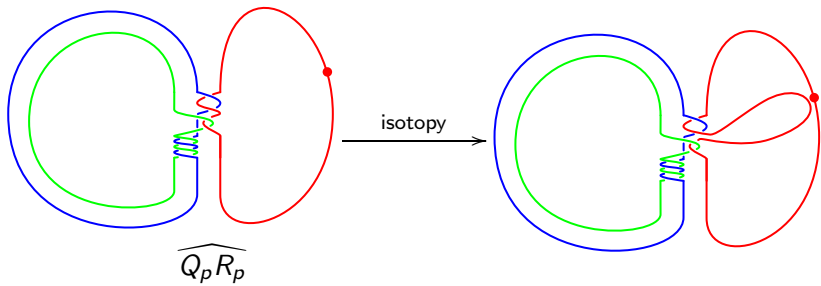

close up to the same 3-component link if and only if

$$q = q', \quad r = r', \quad \mu \equiv \mu' \pmod{\gcd(p, q, r)}.$$

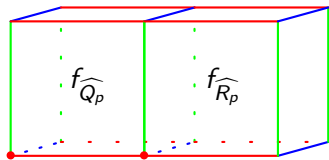

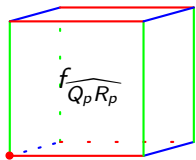

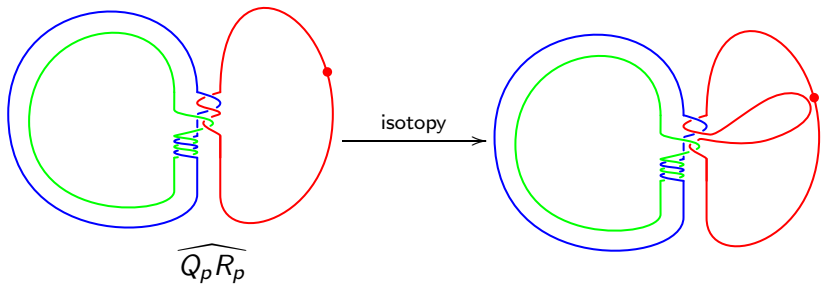

Therefore, to complete the proof of the theorem, we need only show that $\widehat{\mathbb{F}}$ respects the group operations and that

$$\widehat{\mathbb{F}}(Q_p) = Y_p$$

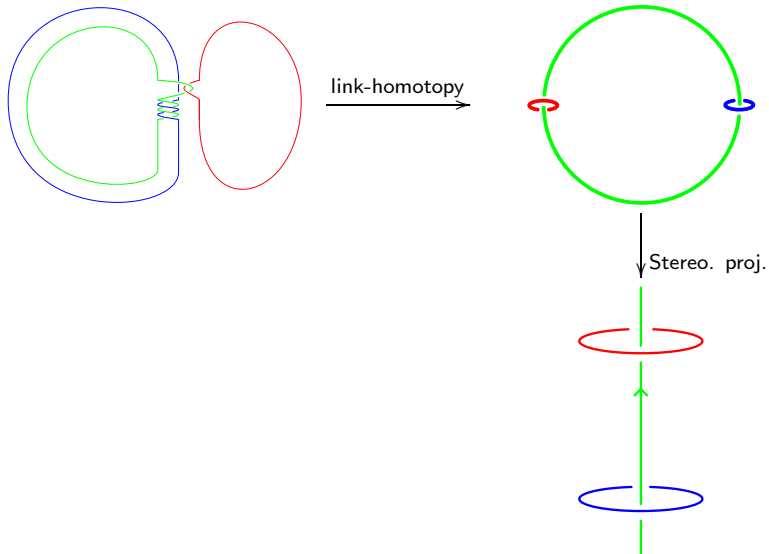

$$\widehat{\mathbb{F}}(R_p) = Z_p$$

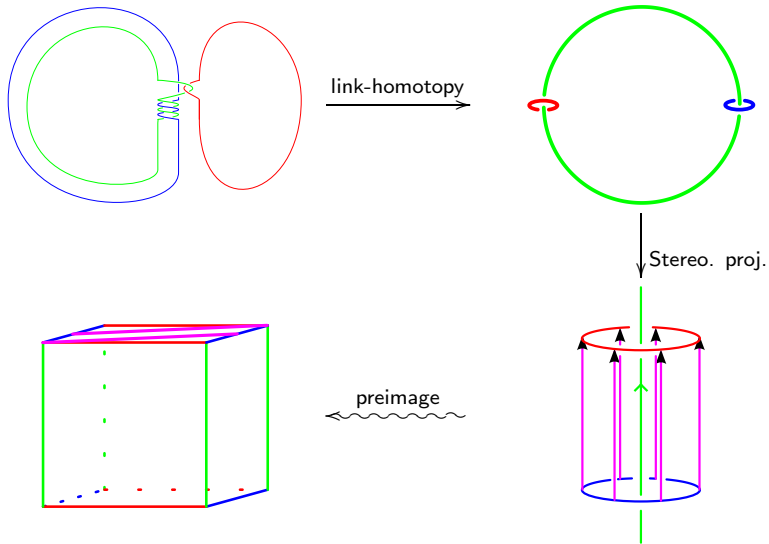

Group Operation

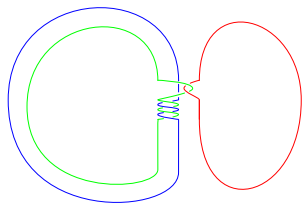

$$\widehat{\mathbb{F}}(Q_p) = Y_p$$

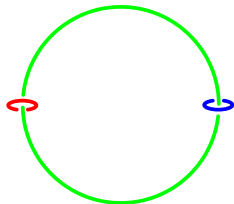

$$\widehat{\mathbb{F}}(Q_p) = Y_p$$

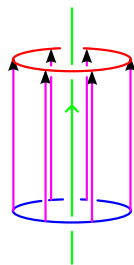

$$\widehat{\mathbb{F}}(Q_p) = Y_p$$
