

Derivative Algorithm : (p. 79/80)

Input: Formula for $f(x)$
 Output: Formula for $f'(x) = \frac{d}{dx} f(x)$

1) How is f put together?

2) Case distinction

if $f(x) = g(x) + h(x)$ then

$$f'(x) = g'(x) + h'(x)$$

elif $f(x) = c \cdot g(x)$ then

$$f'(x) = c \cdot g'(x)$$

elif f is elementary then

the lookup

elif f is power w. constant exponent: then

$$f'(x) = n \cdot x^{n-1}$$

$$f(x) = x^n$$

elif:

$f(x) = g(x) \cdot h(x)$ then $f'(x) = g'(x) \cdot h(x) + g(x) \cdot h'(x)$ Product Rule

elif

$f(x) = g(h(x))$ then $f'(x) = g'(h(x)) \cdot h'(x)$ Chain Rule

elif

$f(x) = \frac{g(x)}{h(x)}$ then $f'(x) = \frac{g'(x) \cdot h(x) - g(x) \cdot h'(x)}{h^2(x)}$ Quotient Rule

polynomial:

$$f(x) = \sum_{i=0}^n a_i x^i$$

$$f'(x) = \sum_{i=1}^n i \cdot a_i x^{i-1}$$

ex: $f(x) = 2x^3 + x + 3$

$$f'(x) = 3 \cdot 2 \cdot x^2 + 1$$

includes constants

$$f(x) = c \cdot x^0$$

$$f'(x) = c \cdot 0 \cdot x^{-1} = 0$$

exit $f(x) = g(x)^{h(x)}$

$$= \exp(\log(g(x)^{h(x)})) = \exp(h(x) \cdot \log(g(x)))$$

↑
Use existing rules

///

fi.
end

Note: $\frac{d}{dx}$ derivative w.r.t.
to particular variable x .

Thus $\frac{d}{dx} y = 0$
↑
not x , different

$f^{(1)}(x) = f'(x)$ is function. So can calculate the derivative:

$$f''(x) = f^{(2)}(x)$$

$$f'''(x) = f^{(3)}(x)$$

Q. Why $\lg'(x) = \frac{1}{x}$?

$$x = \lg(\exp(x))$$

$$1 = \lg'(\exp(x)) \cdot \exp'(x) \quad \left| \begin{array}{l} \text{derivative} \\ \text{change variable} \\ y = \exp(x) \end{array} \right.$$

$$1 = \lg'(y) \cdot y$$

$$= \frac{1}{y} = \lg'(y)$$

$$= \frac{1}{x}$$

Derivative of Quotient: $f(x) = \frac{g(x)}{h(x)} = g(x) \cdot (h(x))^{-1}$

$$= \frac{g'(x) \cdot h(x) - g(x) \cdot h'(x)}{h^2(x)}$$

$$= \frac{g'(x) h(x) - g(x) \cdot h'(x)}{h^2(x)} \quad \text{Quotient Rule}$$

$$Ex: f(x) = \frac{x^2}{\sin(x)}$$

$$f'(x) = \frac{2x \cdot \sin(x) - x^2 \cos(x)}{\sin^2(x)}$$

$$f''(x) = \frac{(2+x^2) \cdot \sin(x) \cdot \sin^2(x) - (2x \sin(x) - x^2 \cos(x)) \cdot 2 \sin(x) \cos(x)}{\sin^4(x)}$$

$$\begin{array}{r} \begin{array}{cc} & \div \\ \frac{x^2}{2x} & \frac{\sin(x)}{\cos(x)} \end{array} \\ \hline \begin{array}{cc} & \div \\ \frac{2x \sin(x) - x^2 \cos(x)}{2 \sin(x) + 2x \cos(x)} & \frac{\sin^2(x)}{x^2 \cos(x)} \end{array} \\ \hline \begin{array}{cc} \begin{array}{cc} 2 \sin(x) + 2x \cos(x) & x^2 \cos(x) \\ -2x \cos(x) + x^2 \sin(x) & \end{array} & \begin{array}{cc} x^2 & \sin(x) \\ 2 \sin(x) \cdot \cos(x) & \end{array} \end{array} \\ \hline \begin{array}{cc} \begin{array}{cc} 2x \sin(x) & x^2 \cos(x) \\ 2 \sin(x) + 2x \cos(x) & \end{array} & \begin{array}{cc} 2x \cos(x) + x^2 (-\sin(x)) & \end{array} \end{array} \\ \hline \begin{array}{cc} \begin{array}{cc} 2x & \sin(x) \\ 2 & \cos(x) \end{array} & \begin{array}{cc} x^2 & \cos(x) \\ 2x & -\sin(x) \end{array} \end{array} \end{array}$$
